

## Artificial Intelligence

Artificial intelligence (AI) refers to computer systems designed to perform tasks that typically require human intelligence, such as problem-solving, learning, and decision-making.

Understanding how to use AI responsibly is crucial for fostering critical thinking, promoting the ethical use of technology, and enhancing efficiencies that improve high-quality teaching and learning for all.

ACPS believes that AI offers transformative opportunities to enhance student learning, address opportunity gaps, and increase operational efficiency. By working collaboratively with families and communities, we can equip students with the knowledge and skills necessary to navigate a world increasingly influenced by AI, while also enhancing the efficiency of our school division's processes.

The ACPS AI Guiding Principles are designed to guide the use of AI to support the division's core values and strategic priorities to improve the instructional and workplace environments for students, teachers and staff. For reasons of staff and student privacy, academic honesty, responsible use, and developmentally appropriate resources, only vetted resources should be used. For more specific information about the Division's expectations, staff, students and families are encouraged to consult the resources found at <http://k12albemarle.org/ai>.
